Module Summary: Preparing Data

Reading and Filtering Data

- Creating a copy of data:

```
DATA output-table;
    SET input-table;
RUN;
```

- Filtering rows in the DATA step:

```
DATA output-table;
    SET input-table;
    WHERE expression;
RUN;
```

- Specifying columns to include in the output data set:

```
DROP col-name <col-name>;
```

```
KEEP col-name <col-name>;
```

- Formatting columns in the DATA step:

```
DATA output-table;
    SET input-table;
    FORMAT col-name format;
RUN;
```

Computing New Columns

- Using expressions to create new columns:

```
DATA output-table;
    SET input-table;
    new-column = expression;
RUN;
```

- The name of the column to be created or updated is listed on the left side of the equals sign.

- Provide an expression on the right side of the equal sign.

- SAS automatically defines the required attributes if the column is new – name, type, and length.

- A new numeric column has a length of 8.

- The length of a new character column is determined based on the length of the assigned string.

- Character strings must be quoted and are case sensitive.

- Creating character columns:

> **LENGTH** *char-column* **$** *length***;**

- Using functions in expressions:

> *function***(***argument1***,** *argument 2, ...***);**

> **DATA** *output-table***;**
>   **SET** *input-table***;**
>   *new-column=function***(***arguments***);**
> **RUN;**

- Functions for calculating summary statistics (ignore missing values):

SUM(*num1, num2, ...***)**	calculates the sum
MEAN(*num1, num2, ...***)**	calculates the mean
MEDIAN(*num1, num2, ...***)**	calculates the median
RANGE(*num1, num2, ...***)**	calculates the range
MIN(*num1, num2, ...***)**	calculates the minimum
MAX(*num1, num2, ...***)**	calculates the maximum
N(*num1, num2, ...***)**	calculates the nonmissing
NMISS(*num1, num2, ...***)**	calculates the missing

- Character functions:

UPCASE(*char1***)** **LOWCASE(***char1***)**	changes letters in a character string to uppercase or lowercase
PROPCASE(*char1***)**	changes the first letter of each word to uppercase and other letters to lowercase
CATS(*char1, char2, ...***)**	concatenates character strings and removes leading and trailing blanks from each argument
SUBSTR(*char, position,* *<length>***)**	returns a substring from a character string

- Date functions that extract information from SAS date values:

MONTH(*sas-date-value***)**	returns a number from 1 through 12 that represents the month
YEAR(*sas-date-value***)**	returns the four-digit year
DAY(*sas-date-value***)**	returns a number from 1 through 31 that represents the day of the month
WEEKDAY(*sas-date-value***)**	returns a number from 1 through 7 that represents the day of the week (Sunday=1)
QTR(*sas-date-value***)**	returns a number from 1 through 4 that represents the quarter

- Date functions that create SAS date values:

TODAY()	returns the current date as a numeric SAS date value
MDY(*month***, ***day***, ***year***)**	returns SAS date value from month, day, and year values
YRDIF(*startdate***, ***enddate***, 'AGE')**	calculates a precise age between two dates. There are various values for the third argument. However, "AGE" should be used for accuracy.

Conditional Processing

- Conditional processing with IF-THEN logic:

> **IF** *expression* **THEN** *statement*;

- Conditional processing with IF-THEN-ELSE:

> **IF** *expression* **THEN** *statement*;
> **<ELSE IF** *expression* **THEN** *statement*;**>**
> **<ELSE IF** *expression* **THEN** *statement*;**>**
> **ELSE** *statement*;

- Processing multiple statements with IF-THEN-DO:

> **IF** *expression* **THEN DO;**
>   *<executable statements>*
> **END;**
> **<ELSE IF** *expression* **THEN DO;**
>   *<executable statements>*
> **END;**
> **ELSE DO;**
>   *<executable statements>*
> **END;**

- After the IF-THEN-DO statement, list any number of executable statements.

- Close each DO block with an END statement.
